

Question **1**

Correct

Marked out of 5.00

As a logic building learner you are given the task to extract the string which has vowel as the first and last characters from the given array of Strings.

Step1: Scan through the array of Strings, extract the Strings with first and last characters as vowels; these strings should be concatenated.

Step2: Convert the concatenated string to lowercase and return it.

If none of the strings in the array has first and last character as vowel, then return no matches found

input1: an integer representing the number of elements in the array.

input2: String array.

Example 1:

input1: 3

input2: {"oreo", "sirish", "apple"}

output: oreoapple

Example 2:

input1: 2

input2: {"Mango", "banana"}

output: no matches found

Explanation:

None of the strings has first and last character as vowel.

Hence the output is no matches found.

Example 3:

input1: 3

input2: {"Ate", "Ace", "Girl"}

output: ateace

**For example:**

Input	Result
3 oreo sirish apple	oreoapple
2 Mango banana	no matches found
3 Ate Ace Girl	ateace

**Answer:** (penalty regime: 0 %)

```

1 import java.util.Scanner;
2
3 public class VowelStringExtractor {
4
5     public static void main(String[] args) {
6         Scanner scanner = new Scanner(System.in);
7
8         int n = 0;
9
10        // Step 1: Input number of elements
11        if (scanner.hasNextInt()) {
12            n = scanner.nextInt();
13            scanner.nextLine(); // Consume the newline
14        } else {
15            System.out.println("Invalid input");
16            return;
17        }
18    }
19 }
```

```

16     return;
17 }
18
19 // Step 2: Input the string array
20 String inputLine = scanner.nextLine();
21 String[] strings = inputLine.split(" ");
22
23 // Validate number of strings
24 if (strings.length != n) {
25     System.out.println("Number of strings does not match the input count");
26     return;
27 }
28
29 // Step 3: Concatenate valid strings
30 StringBuilder result = new StringBuilder();
31 for (String str : strings) {
32     if (str.length() > 0 && isVowel(str.charAt(0)) && isVowel(str.charAt(str.length() - 1))) {
33         result.append(str);
34     }
35 }
36
37 // Step 4: Output the result
38 if (result.length() > 0) {
39     System.out.println(result.toString().toLowerCase());
40 } else {
41     System.out.println("no matches found");
42 }
43
44 scanner.close();
45 }
46
47 private static boolean isVowel(char c) {
48     char lowerC = Character.toLowerCase(c);
49     return lowerC == 'a' || lowerC == 'e' || lowerC == 'i' || lowerC == 'o' || lowerC == 'u';
50 }
51 }
52

```

	Input	Expected	Got	
✓	3 oreo sirish apple	oreoapple	oreoapple	✓
✓	2 Mango banana	no matches found	no matches found	✓
✓	3 Ate Ace Girl	ateace	ateace	✓

Passed all tests! ✓

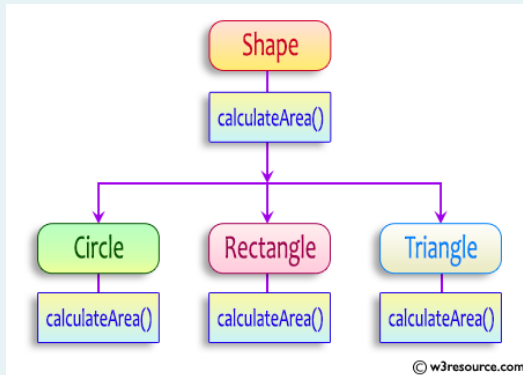

## Question 2

Correct

Marked out of 5.00

Create a base class Shape with a method called calculateArea(). Create three subclasses: Circle, Rectangle, and Triangle. Override the calculateArea() method in each subclass to calculate and return the shape's area.

In the given exercise, here is a simple diagram illustrating polymorphism implementation:

```

abstract class Shape {
    public abstract double calculateArea() ;
}

```

```
System.out.printf("Area of a Triangle :%.2f\n",((0.5)*base*height)); // use this statement
```

sample Input :

```
4 // radius of the circle to calculate area PI*r*r
```

```
5 // length of the rectangle
```

```
6 // breadth of the rectangle to calculate the area of a rectangle
```

```
4 // base of the triangle
```

```
3 // height of the triangle
```

**OUTPUT:**

**Area of a circle :50.27**

**Area of a Rectangle :30.00**

**Area of a Triangle :6.00**

**For example:**

Test	Input	Result
1	4 5 6 4 3	Area of a circle: 50.27 Area of a Rectangle: 30.00 Area of a Triangle: 6.00
2	7 4.5 6.5 2.4 3.6	Area of a circle: 153.94 Area of a Rectangle: 29.25 Area of a Triangle: 4.32

**Answer:** (penalty regime: 0 %)

```

1 import java.util.Scanner;
2
3 abstract class Shape {
4     public abstract double calculateArea();
5 }
6
7 class Circle extends Shape {
8     private double radius;

```

```

9
10 public Circle(double radius) {
11     this.radius = radius;
12 }
13
14 @Override
15 public double calculateArea() {
16     return Math.PI * radius * radius; // Area =  $\pi * r^2$ 
17 }
18 }
19
20 class Rectangle extends Shape {
21     private double length;
22     private double breadth;
23
24     public Rectangle(double length, double breadth) {
25         this.length = length;
26         this.breadth = breadth;
27     }
28
29     @Override
30     public double calculateArea() {
31         return length * breadth; // Area = length * breadth
32     }
33 }
34
35 class Triangle extends Shape {
36     private double base;
37     private double height;
38
39     public Triangle(double base, double height) {
40         this.base = base;
41         this.height = height;
42     }
43
44     @Override
45     public double calculateArea() {
46         return 0.5 * base * height; // Area =  $0.5 * base * height$ 
47     }
48 }
49
50 public class Main {
51     public static void main(String[] args) {
52         Scanner scanner = new Scanner(System.in);

```

	Test	Input	Expected	Got	
✓	1	4 5 6 4 3	Area of a circle: 50.27 Area of a Rectangle: 30.00 Area of a Triangle: 6.00	Area of a circle: 50.27 Area of a Rectangle: 30.00 Area of a Triangle: 6.00	✓
✓	2	7 4.5 6.5 2.4 3.6	Area of a circle: 153.94 Area of a Rectangle: 29.25 Area of a Triangle: 4.32	Area of a circle: 153.94 Area of a Rectangle: 29.25 Area of a Triangle: 4.32	✓

## Question 3

Correct

Marked out of 5.00

## 1. Final Variable:

- Once a variable is declared **final**, its value cannot be changed after it is initialized.
- It must be initialized when it is declared or in the constructor if it's not initialized at declaration.
- It can be used to define constants

```
final int MAX_SPEED = 120; // Constant value, cannot be changed
```

## 2. Final Method:

- A method declared **final** cannot be overridden by subclasses.
- It is used to prevent modification of the method's behavior in derived classes.

```
public final void display() {  
    System.out.println("This is a final method.");  
}
```

## 3. Final Class:

- A class declared as **final** cannot be subclassed (i.e., no other class can inherit from it).
- It is used to prevent a class from being extended and modified.
- ```
public final class Vehicle {  
    // class code  
}
```

**Given a Java Program that contains the bug in it, your task is to clear the bug to the output.**

**you should delete any piece of code.**

**For example:**

| Test | Result                                                                |
|------|-----------------------------------------------------------------------|
| 1    | The maximum speed is: 120 km/h<br>This is a subclass of FinalExample. |

**Answer:** (penalty regime: 0 %)

Reset answer

```
1 public class FinalExample {  
2  
3     // Final variable  
4     public static final int MAX_SPEED = 120; // Corrected initialization  
5  
6     // Final method  
7     public final void display() {  
8         System.out.println("The maximum speed is: " + MAX_SPEED + " km/h");  
9     }  
10  
11     public static void main(String[] args) {  
12         FinalExample example = new FinalExample(); // Corrected object creation  
13         example.display(); // Corrected method call  
14         System.out.println("This is a subclass of FinalExample."); // Complete the output statement  
15     }  
16 }
```

|   | Test | Expected                                                              | Got                                                                   |   |
|---|------|-----------------------------------------------------------------------|-----------------------------------------------------------------------|---|
| ✓ | 1    | The maximum speed is: 120 km/h<br>This is a subclass of FinalExample. | The maximum speed is: 120 km/h<br>This is a subclass of FinalExample. | ✓ |
